What is a speech sound disorder? A speech sound disorder is a communication disorder in which an individual has difficulty producing speech sounds. The nature of the errors may be phonological, motoric or a mix of both. Speech differences, such as dialectical variation or errors consistent with multilingual language acquisition are **NOT** disorders.

Types of Speech Sound Disorders

Speech Difference

variations in speech production that may be **perceived as different from what is mainstream**, but that are **not disordered** (e.g., dialect, multilingual language acquisition, etc.)

Speech Sound Disorders

Phonology

Phonological Impairment

cognitive linguistic difficulty characterized by **pattern-based errors**

Inconsistent Speech Disorder

impaired phonological planning resulting in **inconsistent productions of the same word**

Motor Speech

Articulation Disorder

difficulty with the production (particularly **phonetic placement**) of specific speech sounds

Childhood Apraxia of Speech (CAS)

impairment in **planning and programming** movement sequences impacting speech segments and prosody

Childhood Dysarthria

weakness, slowness, or incoordination of speech movement impacting speech systems including respiration, phonation, resonance and articulation
